

Test 6

1. [3pts] Let  $a, b$  and  $c$  be positive real numbers. Prove that

$$\frac{a^2 + 2bc}{(a + 2b)^2 + (a + 2c)^2} + \frac{b^2 + 2ca}{(b + 2c)^2 + (b + 2a)^2} + \frac{c^2 + 2ab}{(c + 2a)^2 + (c + 2b)^2} \leq \frac{1}{2}.$$

2. [5pts] Three distinct points  $A, B$ , and  $C$  are fixed on a line in this order. Let  $\omega$  be a circle passing through  $A$  and  $C$  whose center does not lie on line  $AC$ . Denote by  $P$  the intersection of the tangents to  $\omega$  at  $A$  and  $C$ . Suppose that  $\omega$  meets segments  $PB$  at  $Q$ . Prove that the intersection of the bisector of  $\angle AQC$  and line  $AC$  does not depend on the choice of  $\omega$ .
3. In the coordinate plane, color the lattice points which have both coordinates even black and all other lattice points white. Let  $P$  be a polygon with black points as vertices. Prove that any white point on or inside  $P$  lies halfway between two black points, both of which lie on or inside  $P$ .
4. [7pts] Let  $\mathbb{R}$  denote the set of real numbers. Find all functions  $f : \mathbb{R} \rightarrow \mathbb{R}$  such that

$$f(x)f(yf(x) - 1) = x^2f(y) - f(x)$$

for all real numbers  $x$  and  $y$ .

- b1. In the coordinate plane, color the lattice points which have both coordinates even black and all other lattice points white. Let  $P$  be a polygon with black points as vertices. Prove that any white point on or inside  $P$  lies halfway between two black points, both of which lie on or inside  $P$ .
- b2. Let  $A_1$  and  $B_1$  be two points on the base  $AB$  of an isosceles triangle  $ABC$  ( $\angle C > 60^\circ$ ) such that  $\angle A_1CB_1 = \angle ABC$ . A circle externally tangent to the circumcircle of triangle  $A_1B_1C$  is tangent also to the rays  $CA$  and  $CB$  at points  $A_2$  and  $B_2$ , respectively. Prove that  $A_2B_2 = 2AB$ .
- b3. Let  $\mathbb{R}$  denote the set of real numbers. Find all functions  $f : \mathbb{R} \rightarrow \mathbb{R}$  such that

$$f(x)f(yf(x) - 1) = x^2f(y) - f(x)$$

for all real numbers  $x$  and  $y$ .

- k1. A robot is placed on an infinite square grid; it is composed of a (finite) connected block of units occupying one square each. A *valid subdivision* of the robot is a partition of its units into two connected pieces which meet along a single unbroken line segment. The robot moves as follows: it may divide into a valid subdivision, then one piece may slide one square sideways so that the result is again a valid subdivision, at which point the pieces rejoin. (See diagram for examples.)

We say a position of the robot (i.e., a connected block of squares in the plane) is *row-convex* if

- (a) the robot does not occupy only a single row or only a single column, and
- (b) no row meets the robot in two or more separate connected blocks.

Prove that from any row-convex position in the plane, the robot can move to any other row-convex position in the plane.

- k2. Given integer  $a$  with  $a > 1$ , an integer  $m$  is *good* if  $m = 200a^k + 4$  for some integer  $k$ . Prove that, for any integer  $n$ , there is a degree  $n$  polynomial with integer coefficients such that  $p(0), p(1), \dots, p(n)$  are distinct good integers.
- k3. Let  $ABC$  be a triangle with  $\omega$  and  $I$  with incircle and incenter, respectively. Circle  $\omega$  touches the sides  $AB, BC$ , and  $CA$  at points  $C_1, A_1$ , and  $B_1$ , respectively. Segments  $AA_1$  and  $BB_1$  meet at point  $G$ . Circle  $\omega_A$  is centered at  $A$  with radius  $AB_1$ . Circles  $\omega_B$  and  $\omega_C$  are defined analogously. Circles  $\omega_A, \omega_B$ , and  $\omega_C$  are externally tangent to circle  $\omega_1$ . Circles  $\omega_A, \omega_B$ , and  $\omega_C$  are internally tangent to circle  $\omega_2$ . Let  $O_1$  and  $O_2$  be the centers of  $\omega_1$  and  $\omega_2$ , respectively. Lines  $A_1B_1$  and  $AB$  meet at  $C_2$ , and lines  $A_1C_1$  and  $AC$  meet at  $B_2$ . Prove that points  $I, G, O_1$ , and  $O_2$  lie on a line  $\ell$  that is perpendicular to line  $B_2C_2$ .
